Empathy Map Canvas

Project: Malaria Detection using Deep Learning

An Empathy Map Canvas helps the project team understand the user's needs, problems, and expectations. It focuses on the user's thoughts, feelings, actions, and challenges when using the malaria detection system. This helps in designing a better and more user-friendly solution.

- **User**

- Primary User:**

- Doctor / Lab Technician / Healthcare Worker

Scenario:

A healthcare worker needs to quickly detect malaria from a blood smear image to provide timely treatment to patients.

Empathy Map

Section	Description
SAYS	"I need a faster way to detect malaria." "Manual diagnosis takes too much time." "Accurate results are important for patient treatment."
THINKS	Thinking about reducing diagnosis time. Concerned about accuracy of results. Looking for technology that can assist diagnosis.
DOES	Collects blood samples from patients. Uses microscope or digital system to analyze blood smear images. Uploads images into the malaria detection system.
FEELS	Pressure to diagnose quickly. Wants confidence in the results. Feels relieved when technology helps provide faster diagnosis.

Pain Points:

- Manual diagnosis is time-consuming.

- Requires trained experts.
- High number of samples can cause delays.
- Human errors may occur during microscopic analysis.

Gains / Needs:

- Faster malaria detection.
- More accurate diagnosis using AI.
- Easy-to-use system for healthcare workers.
- Ability to store and access results quickly.

Outcome:

The empathy map helps the team design a Malaria Detection System using Deep Learning that supports healthcare professionals by providing faster and more reliable diagnosis.
